

Studies show that between 20% and 50% of all community based defibrillators internationally are not rescue ready at any point in time. Checks need to be done daily, but many are not checked regularly, even monthly.

Life at 24/7

Using simple 24/7 monitored cabinets to store your defibrillator means that your equipment is being checked every minute of every day, even if you are away on holiday.

Imagine a 999 call, and being told to collect the nearest defibrillator. When taken to the patient you find this is out of service, or does not work. It was checked by the caretaker only a few days ago, but since then developed a fault, or maybe has been used. As it will not be checked again for almost a month, then this life saving equipment will not be available for further rescues. How would you feel to know a life may have been saved?

Defibrillators are medical devices and need to be checked daily in line with the manufacturer's recommendations. Weekly and monthly checks are no longer acceptable, as shown by the very large numbers out of service throughout the world. Monitored cabinets help, and whilst they have a running cost (4G or 5G like your mobile), is it not better to have this reassurance?

Life at 24/7

Dashboards help you manage your defibrillator estate, allowing you to see the Rescue Ready status of any of your defibrillators; be alerted by text and email when it is used or taken (and returned), and to be able to analyse and check the status of any site remotely. Compatible with most major makes of AED, the system allows the ability to swap out makes and models without reprogramming. Ideal for company use, or where a single person looks after a large number of sites.

Only by constant 24/7 monitoring can the Rescue Ready status of all defibrillators be validated, reducing risk of failure and coroner enquiries.
